

SPECIFICATION AMENDMENT

1. Please replace the paragraph beginning at line 1 page 10 with the following amended paragraph:

[0046] The header 217 contains a field 219 which, in turn, contains a sequential number for transmission packet 218. The header 217 further contains a field 220 in which is alternately indicated an identifier on the basis of which the position of the data packet 211 within the respective interleaver block 204 can be determined ~~and~~or a width of the respective interleaver block 204. The header 217 furthermore contains a field 221 in which is indicated a time stamp for the respective interleaver block 204, with each interleaver block of an image sequence receiving a different value as the time stamp so that individual interleaver blocks are mutually distinguishable. It should be noted here that the sequence of digital data 201 contains several progressively encoded units, with it preferably being the case that one each of a unit of this kind is filed in the interleaver block. The interleaver blocks can vary in length depending on the progressively encoded unit. Individual images in the sequence of digital data 201 are preferably progressively encoded.
